Is Treatment for Opioid Use Disorder Affordable for Those Without Health Insurance?

By Kristi Martin

While recent policy efforts at the state and federal levels have expanded health insurance coverage for medications for opioid use disorder (MOUD), people without such coverage may struggle to afford this treatment. An estimated one of six nonelderly adults in need of MOUD are uninsured.¹ To find care, these patients may turn to community health centers, federal public health clinics, free and charitable clinics, and state-operated treatment programs.

Because opioid use disorder is a chronic condition, treatment with MOUD is often not a one-time event or short term; treatment costs may be incurred for months or years. Recent evidence suggests that duration mediates the effectiveness of MOUD, with people who stay in treatment for 12 months to 18 months having better outcomes than those who stay in treatment for shorter periods. To pay for MOUD, those without insurance may seek out Patient Assistance Programs or drug discount cards. Yet, these resources have limitations that contribute to treatment disruptions, uncoordinated care, and high out-of-pocket costs.

### Breakdown Among Those Diagnosed with OUD by Insurance Source

- Covered by Medicaid: 615,000
- Covered by private insurance: 550,000
- Uninsured: 271,000
- Covered by Medicare: 264,000

### KEY TAKEAWAYS

1. One of six patients in need of medications for opioid use disorder (MOUD) is uninsured.
2. Uninsured patients may face high out-of-pocket costs for MOUD. The capacity of community health centers, free clinics, patient assistance programs, drug discount cards, and other resources is insufficient to meet demand.
3. Enrolling more people in subsidized private coverage or Medicaid as well as federal funding to safety-net providers and state programs could expand access to affordable MOUD services.
This issue brief provides an overview of access to three forms of MOUD — buprenorphine, buprenorphine-naloxone, and naltrexone — for individuals who are uninsured or otherwise pay out of pocket for treatment. It does not include analysis of methadone treatment because of its more limited availability through opioid treatment programs certified by the Substance Abuse and Mental Health Services Administration (SAMHSA) compared to other forms of MOUD. In addition, the brief makes recommendations for ways to increase access to affordable MOUD services for uninsured patients and support the safety-net providers who care for them.

UNINSURED PATIENTS PAY THE MOST AMONG THOSE SEEKING MOUD

Uninsured patients typically pay the list price for prescription drugs, including MOUD. A study from the U.S. Department of Health and Human Services (HHS) estimated the monthly costs for uninsured patients in 2014 for buprenorphine or buprenorphine-naloxone prescriptions to be a median of $539, not including office visits and counseling services, compared with median out-of-pocket costs of $25 per month for commercially insured patients. Medicare and Medicaid also limit beneficiaries’ cost-sharing on MOUD services. Patients’ out-of-pocket costs have been identified by providers as a barrier in accessing treatment.

Summary Table of Medications for Opioid Use Disorder

<table>
<thead>
<tr>
<th>MOUD</th>
<th>Formulations</th>
<th>Setting</th>
<th>Estimated Monthly Costs Without Insurance</th>
</tr>
</thead>
</table>
| Buprenorphine (brand names include Probuphine, Sublocade, Brixadi) | Extended release injectable, film, patch, implant, tablet | Buprenorphine initiation may take place in an office or home setting. | • $1,161–$3,483 for injectable  
• $183–$451 for film  
• $81–$215 for patch  
• $206 for implant  
• $106–$189 for tablet |
| Buprenorphine-naloxone (brand names include Zubsolv, Suboxone, Bunavail) | Film, tablet                  | Buprenorphine-naloxone initiation may take place in an office or home setting. | • $112–$518 for film  
• $92–$549 for tablet |
| Naltrexone (brand names include Vivitrol, Revia)                  | Extended release injectable, tablet | Naltrexone can be prescribed in any setting by any health care provider with the authority to prescribe medication. | • $700–$1,100 for injectable  
• $25–$60 for tablet |

OPTIONS FOR MOUD TREATMENT FOR UNINSURED PATIENTS

Increased funding for behavioral health and addiction treatment services in community health centers and other efforts targeting uninsured patients have expanded access to MOUD. Still, most programs available to uninsured patients have inadequate resources to meet demand. Beyond high costs, patients may face challenges in locating providers and have difficulty finding transportation and child care, among other barriers.

Community Health Centers and the 340B Program

Federally qualified health centers (FQHCs), look-alike FQHCs, Health Care for the Homeless clinics, and rural health clinics (collectively referred to as community health centers) must offer sliding-scale fees and provide services, regardless of a patient's ability to pay.2 The centers are not permitted to charge any fees to patients with annual incomes at or below 100 percent of the federal poverty level ($26,500 for a family of four) and must offer discounts based on a sliding-scale to people with income below 200 percent of the federal poverty level.

The number of community health centers providing MOUD has increased from 47 percent in 2018 to 64 percent in 2019. The increase can be attributed to Medicaid expansion, which bolstered health centers’ finances and made them more likely to offer behavioral health treatment, as well as additional federal grant funding to expand mental health and substance use disorder services. Of the community health centers offering MOUD, 65 percent provided multiple forms, with buprenorphine (89 percent) and naltrexone (69 percent) being the most common. Nearly a third of community health centers cited the high cost of providing MOUD as a barrier to further expanding services.

Community health centers and other types of safety-net providers have access to deeply discounted prices for prescription drugs through the 340B Drug Pricing Program, which requires drug manufacturers who participate in Medicaid to provide discounts on drug prices to providers that serve a substantial proportion of low-income patients. While the discounted amounts are not public, they are thought to be significant — as much as 90 percent for certain drugs. Providers rely on these discounts to afford prescription drugs for their patients, but they are not required to pass on the discounted prices to patients and do not have to apply a sliding-scale fee schedule to drugs as is required for other services.

Free and Charitable Clinics

Free and charitable clinics operate through private donations. Little is known about how many such clinics offer MOUD and the costs to patients.

Although these clinics do not have access to 340B discounts, some receive donated drugs. One such organization is called Direct Relief, which distributes naloxone but does not appear to offer MOUD. Another organization, RxOutreach, is a nonprofit pharmacy that works with patients and providers. RxOutreach provides Zubsolv and Suboxone (both forms of buprenorphine/naloxone) for $50 for a 30-day supply and naltrexone tablets for $30 for a 30-day supply. These prices are more than 60 percent discounted from the list prices that uninsured patients might otherwise pay.
Patient Assistance Programs and Drug Discount Cards

Uninsured patients may be eligible for certain programs that can reduce their out-of-pocket costs for prescription drugs. These programs include patient assistance programs sponsored by drug manufacturers as well as independent programs. Most programs limit the discounts in some way and do not provide a reliable source of affordable MOUD. For example, a drug manufacturer may offer products on a limited basis through “free trial” vouchers. Some programs limit the quantity of drugs that can be discounted or how many of a provider’s patients can participate. Drug coupons offered by GoodRx, OptumPerks, SingleCare, and HelpRx offer discounts for some forms of MOUD to self-pay patients at the pharmacy.

State-Operated Programs

Some states are using State Opioid Response Grants provided by the Substance Abuse and Mental Health Services Administration to extend access to MOUD for uninsured patients. In 2018, California, Colorado, Idaho, Indiana, Louisiana, South Carolina, and Washington used this grant funding to do so. A review of the programs revealed a wide range of targeted populations as well as varying coverage of buprenorphine, buprenorphine/naloxone, and naltrexone. Most provided access to methadone, and several used the funding to expand capacity to offer another form of MOUD, such as Suboxone, Vivitrol, or buprenorphine. Many provide financial assistance to help patients pay for MOUD and focus on particularly high-risk populations, such as pregnant women, individuals with serious mental illnesses such as schizophrenia, currently or formerly incarcerated individuals, individuals experiencing homelessness, or veterans.

In September 2021, SAMHSA awarded $71.3 million in federal grants to 127 programs seeking to expand access to medication-based treatment for prescription drug and opioid addiction. Grantees, which include states, nonprofit organizations, and American Indian tribes or tribal organizations, must provide at least one of the medications approved by the U.S. Food and Drug Administration in combination with comprehensive psychosocial services.

Example Programs Funded by Federal Grants to Expand Access to MOUD

WASHINGTON
Harborview Medical Center
Focuses on expanding access to MOUD among people experiencing homelessness and individuals with a recent emergency department visit; includes buprenorphine, Suboxone, and naltrexone.

INDIANA
Recovery Now!
Focuses on expanding access to MOUD to low-income pregnant women, recently incarcerated people, and high-risk drug use populations; includes buprenorphine and naltrexone.

DELAWARE
Brandywine Counseling and Community Services, Inc.
Focuses on expanding access to MOUD among adults with prior unsuccessful opioid detoxifications or history of accidental drug overdose experiences; those reentering the community from jail/prison; those who are homeless, military veterans, women with children, LGBTQ+ people; and those with or at high risk for contracting HIV/AIDS/Hepatitis.

POLICY IMPLICATIONS

Compared with those with private or public health insurance coverage, uninsured patients may face high out-of-pocket costs and other barriers to accessing MOUD services. The following policy changes would make MOUD more accessible and affordable for them.

**Facilitate and simplify health insurance enrollment for uninsured individuals.** The coverage expansions enabled by the Affordable Care Act could benefit some uninsured individuals with opioid use disorder. Policies such as auto-enrollment and presumptive eligibility for Medicaid or subsidized marketplace coverage could give more people access to affordable MOUD services.

**Provide federal funding to public clinics and state-operated programs to expand access.** For individuals who are not eligible for subsidized private coverage or Medicaid, federal funds could help safety-net providers and state programs expand MOUD services. In particular, funds are needed to enable these programs to pay for multiple forms of MOUD, hire enough providers to meet demand, and offset the costs of providing MOUD for providers and patients. These programs have a disproportionately high number of patients in need of MOUD services and demand exceeds supply.

ENDNOTES

2. Section 330(k)(3)(G) of the Public Health Service Act.
Author

Kristi Martin, M.P.A., is a policy strategist focused on health care, drawing on her decades of experience working in the public sector, with private-sector clients, and in philanthropy. She is now the senior advisor to the Centers for Medicare and Medicaid Services deputy administrator for Medicare. She was previously the vice president for health care at Arnold Ventures where she led the philanthropy’s prescription drug pricing portfolio and was the managing director of Waxman Strategies’ health practice where she worked alongside Congressman Henry Waxman driving toward progressive outcomes in health policy. Martin served several years in the U.S. Department of Health and Human Services, Office of Personnel Management, and Government Accountability Office. As a senior advisor in the Obama administration’s Office of Health Reform, she had primary oversight responsibility for the coordinated and timely implementation of cross-cutting departmental public health and prevention initiatives under the Affordable Care Act, including addressing the rising cost of drugs and setting up the women’s preventive services initiative. Martin received her bachelor’s and master’s in health communication from the University of Kentucky and a master’s of public administration from George Washington University.
